

TEAM UPDATE • 01 OCTOBER 2026

IT Asset Submission Acknowledgement App

From five tools and manual typing to one screen and a signed PDF

Presented by Sriram R

The screenshot shows a web application interface for 'OPTUM IT Asset Submission Acknowledgement'. The interface is divided into several sections: 'Employee' details (Business Unit, Employee ID, Employee Name, Manager Name, Location), 'Asset Details' (Current Asset Serial Number, UATX Report, New Device Serial Number, Asset Requested Reason, Asset Type, Asset Category, Asset Location), 'Submission Type' (New Hire, Internal Transfer, Laptop Return, RDP, Asset Transfer, Contractor LAD, Other), and 'Signatures' (Employee Signature, Asset Receiver Signature). There are buttons for 'Bulk Batch', 'Generate Documents', 'Print Form', 'Start Another Form', and 'Generate Signed PDF'. The interface is clean and modern, with a white background and blue accents.

Real app screen - sample data

Good morning everyone, and thank you for the time.

Today I want to show you something I've been building for our team: the IT Asset Submission Acknowledgement app.

Every time we issue, swap or collect a laptop, we fill in an acknowledgement form and get it signed. It's a small task, but we do it many times a day, and on new-joiner and exit days we do it in bulk.

In the next ten minutes I'll show you what the process looks like today, what the app does, a quick look at the screens, where we stand, and what support I need to roll it out to the team.

(Everything you'll see on screen is real app screens - the names and IDs are sample data.)

Today, one form means five tools

Every issue, swap or return is done by hand, person by person

Look up name & manager
AD report in the browser

Find the new laptop
SSRS asset report

Find the current laptop serial
Search TracIT

Type it all into the Word form
Then sign with Acrobat + the Topaz plug-in

Save, name, file & email the PDF
Folder and file name chosen by hand

What this costs us

- Retyping IDs and serial numbers invites typos
- Bulk days (new joiners, exits) take hours
- File names and folders differ by person
- Depends on Acrobat + the Topaz plug-in on every PC
- No single record of what was generated

IT Asset Submission Acknowledgement · 2

Let me start with how we do this today.

For one person, we open the AD report to get the employee's name and manager. For a new hire or break-fix we check the SSRS report for the new laptop. For an exit or break-fix we search TracIT for the current laptop's serial number.

Then we type all of that into the Business Unit's Word form, sign it with Acrobat and the Topaz plug-in, save it, pick a file name and folder, and for exits we write an email.

That's five different tools for one form. It works, but it's slow, especially on bulk days. Every time we retype an ID or a serial number there's a chance of a typo. Everyone saves files a little differently. And there's no single place to see what was generated.

The app: type the Employee ID, everything else fills itself

The screenshot shows the 'IT Asset Submission Acknowledgement' application. The top bar includes the OPTUM logo and tabs for 'Single Person', 'Bulk Batch', and 'Generated Documents'. The main form is divided into several sections: 'Employee' with fields for Business Unit, Employee ID (000123456), Employee Name (Ananya Rao), Manager Name (Karthik Menon), and Contact Number (98456 12345); 'Submission Type' with radio buttons for New Hire, Mixed Build, Laptop Return, LWD, RCP, Break Fix, Additional Laptop, Contractor LWD, and Site Transfer; 'Asset Details' with fields for Current Device Serial Number (SCD3920LMB), SSRS Report (filled from SSRS), and New Device Serial Number (SG4512K06); and 'Signatures' with fields for Employee Signature and Asset Receiver Signature. A 'Generate Signed PDF' button is located at the bottom right.

- 1 **Name & manager**
from Active Directory, automatically
- 2 **Submission type & new laptop**
from the SSRS report
- 3 **Current laptop serial**
from the TracIT report
- 4 **Sign & generate**
Topaz pad or on-screen, then one click for the signed PDF

This is the app. One screen for a single person.

You scan or type the Employee ID, and within about a second the app fills in the name and manager straight from Active Directory - the same data as the AD report, but no browser, no copy-paste.

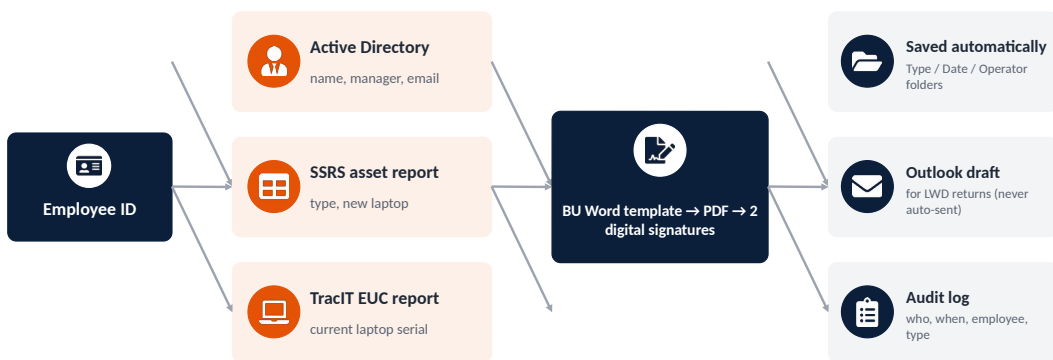

At the same time it checks the SSRS report. If the person is there, it picks the submission type for us - here it chose Break Fix - and fills the new laptop serial.

For the current laptop, it reads the TracIT EUC report for our location and fills the serial number. You can see the green messages telling you where each value came from.

Then the employee signs on the Topaz pad, the receiver signs, and one click generates the signed PDF. If any source doesn't have the person, the app just tells you, and you type that field by hand - nothing breaks.

How it works

One Employee ID in - a signed, filed, logged PDF out

IT Asset Submission Acknowledgement - 4

Here's what happens behind the scenes - in plain terms.

The only input is the Employee ID. From that, the app asks three sources:

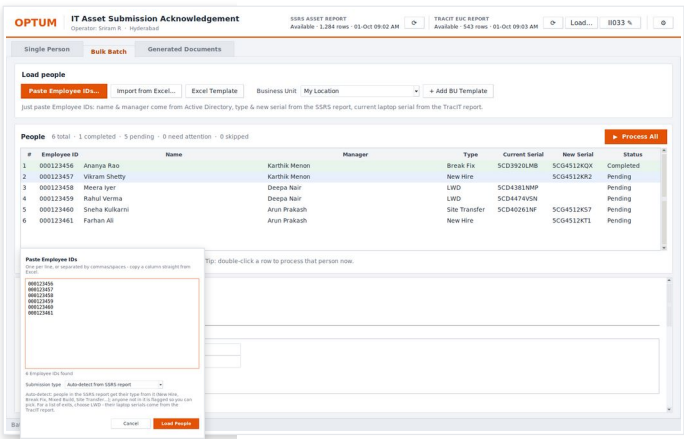

- Active Directory gives the name, manager and email. It uses our own Windows login, so there's no password stored anywhere.
- The SSRS asset report, which the app downloads once a day, tells us if this is a new hire, break-fix and so on, and the new laptop serial.
- The TracIT EUC report for our location gives the laptop the person currently has.

The app then fills the Business Unit's own Word template, so the form looks exactly like today's, converts it to PDF and applies two real digital signatures - employee and asset receiver.

Finally it saves the file into a standard folder structure with a standard file name, opens an Outlook draft for exits - it never sends anything by itself - and writes a line to the audit log.

Bulk days: paste a list of IDs, the app does the rest

- Paste Employee IDs straight from Excel or an email
- Names & managers fill in automatically in the background
- Type and serials come from SSRS and TracIT
- Work through the list, or let it auto-advance
- Only stops where a person is needed: signatures

IT Asset Submission Acknowledgement · 5

Now the part I think will help us most: bulk days.

Instead of preparing a spreadsheet, you just copy the list of Employee IDs - from Excel, from an email, from anywhere - and paste it. The small window on the left is that paste box.

The app loads everyone into a list. While you start on the first person, it looks up everyone's name and manager in the background. Types and serial numbers come from the SSRS and TracIT reports, so the list on the right fills itself in - you can see type, current serial, new serial and status for each person.

For a list of exits you just choose LWD once, and every laptop serial comes from TracIT.

Then you work down the list - or click Process All and it moves to the next person automatically. It only stops where we genuinely need a human: the signatures.

The result: a signed PDF on the same BU form

IT Asset Submission Acknowledgement Form

New Hire ☐ Break Fix ☐ Mixed Build ☐ Additional Laptop ☐ Laptop Return ☐
Contractor (EMP) ☐ EMP ☐ Site Transfer ☐ RPT ☐

Date of the Site: _____ Emp ID: 00000000
Emp Name: Susan Lee Contact Number: 9890 0000
Manager Name: Susan Jones Last Working Date: _____

Current Device Serial Number	SC0392A16
New Device Serial Number	SC0412N2R
List of Assets Issued/Return	Laptop Bag ☐ Charger ☐ Mouse ☐ Headset ☐ Network Cable ☐ Multiport ☐ Others: _____
Asset Pending for Submission (If Any)	
Signature Of Employee	
Asset Receiver Signature	 Signed On: 11/06/2020 10:30 AM

Real digital signatures

Employee and asset receiver - tamper-evident, checkable in Adobe's Signature panel

Signed-on date & time

Printed under each signature automatically

Filed the same way every time

Type \ Date \ Operator \ EmpID_Type_time.pdf

No Acrobat needed to create it

The app signs the PDF itself; Topaz pad or on-screen signing

IT Asset Submission Acknowledgement - 6

This is what comes out - the same Business Unit form we use today, filled in, with both signatures.

Four things to point out.

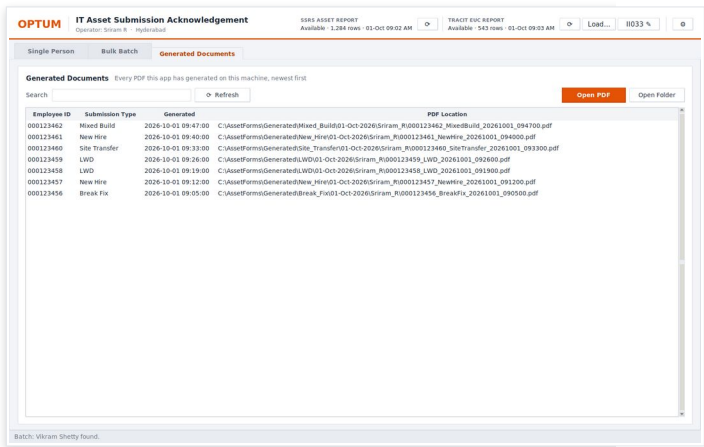

First, these are real digital signatures, not just pictures pasted in. If anyone changes the PDF afterwards, Adobe will show the signature as broken. You can open the Signature panel in Adobe and see who signed and when.

Second, the date and time of signing are printed under each signature automatically.

Third, every file is saved the same way - by submission type, then date, then operator, with the Employee ID and type in the file name - so anyone can find any form.

And fourth, we no longer need Acrobat to create these. The app signs the PDF itself, with the Topaz pad when it's connected, or on screen when it isn't.

Every form is logged and easy to find

Audit log

Time, operator, Employee ID, type, data source, file location - one line per form

Search & open

Find by ID or type, open the PDF or its folder in one click

Details inside the PDF

Employee, type and operator stored in the PDF's properties

IT Asset Submission Acknowledgement · 7

Every time a PDF is generated - or fails - the app writes one line to an audit log: when, who, which employee, which type, where the data came from, and where the file was saved.

The Generated Documents tab shows that history. You can search by Employee ID or type, and open the PDF or its folder in one click. So if someone asks "do we have the signed form for this person?", we can answer in seconds.

The same details are also stored inside the PDF's own properties.

Built to be safe and simple to support

Your own Windows login

AD and SSRS use the signed-in user. No passwords stored or typed in the app.

Data stays inside

Runs on the PC, talks only to our internal systems. Nothing goes to the cloud.

Tamper-evident PDFs

Each form carries two digital signatures that break if the file is edited.

Full audit trail

Every generation is logged with operator, time and file location.

Never blocks the work

If a source is down, the app says so and the field is typed by hand.

Nothing sent automatically

Emails open as drafts for us to review and send ourselves.

IT Asset Submission Acknowledgement - 8

A word on safety, because I know that matters.

The app uses our own Windows login to read Active Directory and the SSRS report - there are no passwords stored in it. Everything runs on our PC and talks only to our internal systems; nothing is sent to the cloud.

The PDFs carry digital signatures, so any edit after signing is visible. Every form is logged.

And it's designed never to block us: if Active Directory, SSRS or TracIT can't be reached, the app tells you and you type that field by hand. Emails are only ever drafts - we review and send them ourselves.

One point for transparency: the signing certificate is created by the app itself, so Adobe shows the signature as valid but from a certificate it doesn't yet know. IT can make it fully trusted by installing that certificate - that's one of my asks at the end.

What changes for the team

5 → 1

tools per form

AD, SSRS, TracIT, Word and Acrobat become one screen

0

retyped IDs & serials

when the person is in AD, SSRS and TracIT

1 paste

to load a whole batch

names, types and serials fill themselves in

100%

of forms logged

same folders, same file names, one history

Next step: measure it. During the pilot we'll time forms before and after, and count corrections, so we can report real time saved.

IT Asset Submission Acknowledgement · 9

So what does this change for us?

Five tools become one screen. When a person is in AD, SSRS and TracIT, we don't retype a single ID or serial number - which removes the most common source of mistakes. On bulk days, one paste loads the whole batch. And every form is filed the same way and logged.

I've deliberately not put a minutes-saved number on this slide, because I'd rather measure it than guess. During the pilot we'll time a few forms the old way and the new way, and count corrections, and I'll come back with real numbers.

Where we are

Done

- Single person & bulk processing
- Active Directory auto lookup
- SSRS: type + new laptop
- TracIT report: current laptop
- Topaz pad & on-screen signing
- Signed PDF, filing, audit log
- Outlook drafts for exits
- New, cleaner screens

In progress

- TracIT report downloads itself daily (today: one click on 'Load...' with the exported report)
- Final checks on touchpad scrolling

Next

- 2-week pilot with the team
- ServiceNow live new-hire data
- Trusted signing certificate (IT)
- One-click install for everyone

IT Asset Submission Acknowledgement · 10

Here's where we are.

Done: the single-person and bulk screens, the automatic Active Directory lookup, the SSRS and TracIT data, Topaz and on-screen signing, the signed and filed PDF with audit log, Outlook drafts for exits, and the new screens you've just seen. I'm using it now.

In progress: I'm making the TracIT report download itself every morning. Until that's finished, it's one extra click - export the EUC report from TracIT and use 'Load' in the app. That's what I'm doing today.

Next: a two-week pilot with the team, live new-hire data from ServiceNow, a trusted signing certificate from IT, and a simple install so everyone can use it.

What I need to roll it out

1

2-3 pilot volunteers for two weeks

Use it on real issues and returns, share what's missing

2

IT security review & trusted certificate

So Adobe shows our signatures as fully trusted for everyone

3

A contact in the TracIT team

To confirm we can pull the EUC report automatically each day

4

ServiceNow new-hire table details

So same-day new hires fill in automatically too

IT Asset Submission Acknowledgement · 11

To take this from my desk to the whole team, I need four things.

One: two or three volunteers to use it for two weeks on real issues and returns, and tell me what's missing.

Two: support for an IT security review, and for IT to install the app's signing certificate as trusted, so Adobe shows our signatures as fully trusted for everyone.

Three: a contact in the TracIT team, so we can confirm the right way to pull the EUC report automatically every day.

And four: the ServiceNow table details for new-hire requests, so people who joined the same day fill in automatically too.

(Pause - look to the director.) If we can agree on the pilot today, I can start next week.

Thank you

Questions, and a 2-minute live demo

Sriram R

Thank you - happy to take questions, and I can show it live for two minutes.

Demo: 1) Single Person: type an Employee ID - name and manager appear. 2) Point at the green "In SSRS report" / "Filled from TracIT report" messages. 3) Sign Now twice, Generate Signed PDF, open it. 4) Bulk: Paste Employee IDs, Load People, watch names fill in.

Likely questions:

- Secure? Uses our Windows login, no stored passwords, internal systems only.
- AD or TracIT down? It says so; you type that field by hand.
- Needs Acrobat? Not to create or sign. Any PDF viewer opens them.
- Rollout? Two-week pilot, then a simple install for the team.
